广州悦洋生物技术有限公司

临床案例 Clinical cases

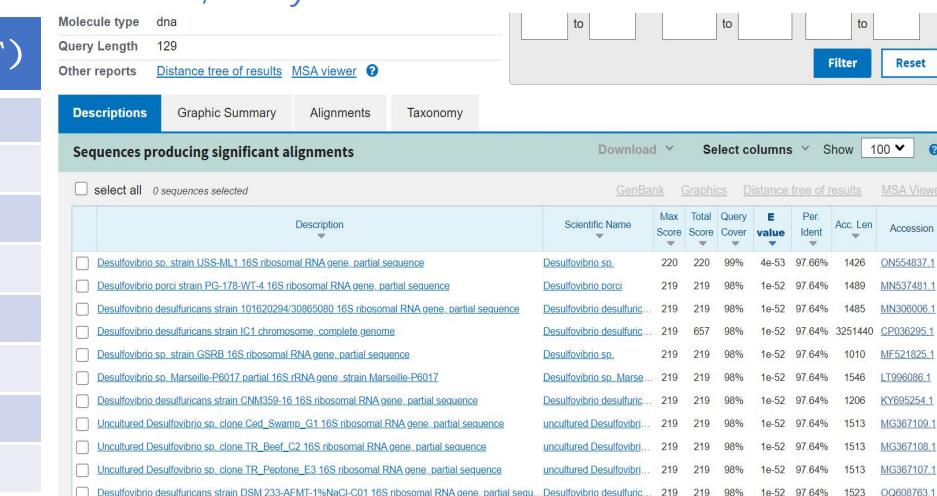

- 某集团公司场发生腹泻：后备母猪，180日龄左右，秋季10月发病，发病数量62头，拉土黄色稀粪。
 > Diarrhea occurred in a group of farms: reserve sows, about 180 days old, onset of disease in October in the fall, the number of onset of disease was 62, with soil-yellow scanty feces.>
- 检测：采集肛拭子A试剂阴性、某第三方检测公司阴性，YY试剂阳性。复核：YY检测了常见腹泻病原，部分样品*L. i*核酸强阳，测序与*L. i*同源性98~99%。最终确定为胞内劳森氏菌感染。
 > Test: The anal swab collected was negative for reagent A, negative for a third-party testing company, and positive for reagent YY. Re check: YY detected the common diarrhea pathogen, and some samples were strongly positive for *L. i* nucleic acid. Sequencings showed 98~99% homology with *L. i*. Finally, it was determined that the infection was caused by *Lawsonia cytidis*.
- ✓ 处理方案及结果：大环内酯类（泰乐菌素）+季铵盐消毒，5天后基本恢复平稳。
 > Treatment plan and results: macrolides (tylosin)+ quaternary ammonium salt disinfection, 5 days after the return to stable.

疑似回肠炎导致的腹泻
Diarrhea due to suspected ileitis

*L. i*感染后抗原抗体的消长规律

Growth and decline of antigen and antibody after infection

回肠炎发生后： Ileitis occurs

- ✓ 临床症状1.5~4.5周；
✓ Clinical symptoms 1.5 to 4.5 weeks.
- ✓ 1周后可从粪便中检测到核酸
(PCR)； ✓ Nucleic acid (PCR) can be detected in feces after 1 week;
- ✓ 2周内可检测到IFN-γ (ELISPOT)；
✓ IFN can be detected within 2 weeks - Y(ELISPOT)
- ✓ 2周后可检测到抗体 (ELISA)，
持续时间长

Antibody can be detected after 2 weeks (ELISA), and the duration is long

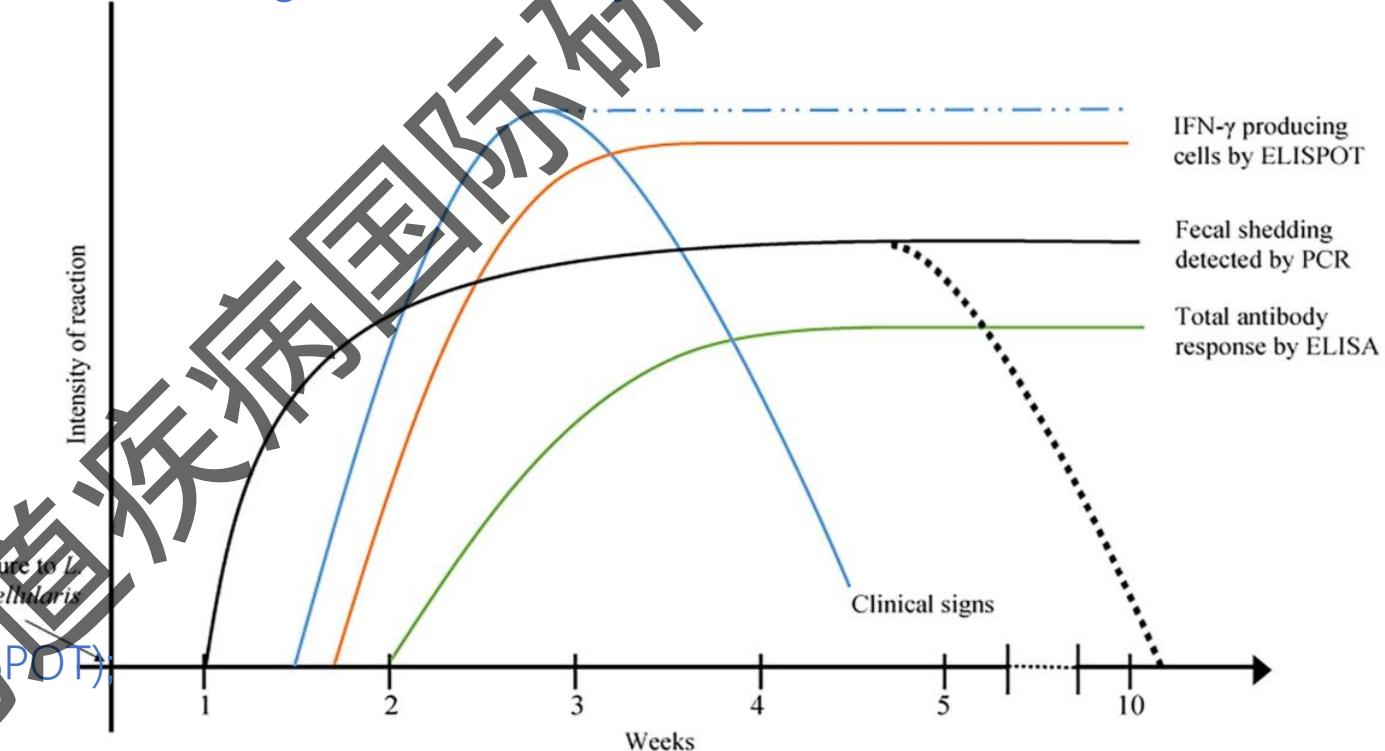

Figure 2. Detection of *Lawsonia intracellularis* infection. **A.** Time post-infection of detection of infection by each technique. Boldfaced techniques are those most widely used in veterinary diagnostic laboratories globally. dpi = days post-infection. **B.** Graphic representation of the course of *L. intracellularis* infection, clinical signs, immune reaction, and adaptive immune response. Solid blue line = clinical signs with interventions. Dashed blue line = clinical signs without interventions. Orange line = IFN- γ detection. Solid black line = fecal shedding detection without interventions. Dotted black line = fecal shedding detection with interventions. Green line = total antibody response.

猪胞内劳森菌(猪回肠炎)间接
ELISA抗体检测试剂盒

回肠炎抗体检测试剂盒的立项背景

The background of the project for the ileitis antibody test kit

- 减抗禁抗的背景下, *L. i*对养猪业带来的经济损失将愈加严重。

Against the background of resistance reduction and resistance prohibition, the economic losses caused by *L. i* to the pig industry will become more and more serious.

- 猪群感染后间歇性排菌, PCR不能完全准确检测猪群状态。

The pigs were discharged intermittently after infection, and PCR could not completely and accurately detect the status of pigs.

- 目前国内外尚缺乏可靠、准确、适的用商品化ELISA 抗体诊断试剂盒。

At present, there is a lack of reliable, accurate and suitable commercial ELISA antibody diagnostic kits at home and abroad.

- 旨在为回肠炎流行病学调查、疫苗免疫或药物效果评估、疾病净化效果评估提供有效工具

Aiming to provide an effective tool for the epidemiological investigation of ileitis, the assessment of the effectiveness of vaccine immunization or drugs, and the assessment of the effectiveness of disease decontamination

ELISA

Several ELISAs have been developed for the detection of *L. intracellularis* antibodies in serum.^{16,44,54,61} Most are competitive ELISAs, the major advantage of which is their ability to selectively detect the antibody recognized by the plated antigen, even in crude or impure samples. To date, only one commercial kit is available (Svanovir *L. intracellularis/Ileitis-Ab*; Table 1).^{44,109} This test is unable to quantify the response against *L. intracellularis*, and sensitivity may vary depending on the value of percent inhibition (PI) selected; at PI = 35, the test sensitivity is 72% and the specificity reaches 93%.⁴⁴ *Lawsonia*-specific serum antibody responses, IgG and IgM, can be detected in serum 2 wk after infection (Fig. 2B); they peak at 3–4 wk and remain detectable for up to 13 wk post-infection.^{31,82}

R&D process for animal diagnostic products (antibodies)

动物诊断制品（抗体）的研发流程

laboratory tests

实验室试验

- 病原体基础种子建立和鉴定：抗原性、特异性和纯净性、保存条件
- 比较实验：与全菌体等、其他片段
- 生产工艺研究：抗原制备
- 诊断方法优化
- 组装和成品检验
- 试剂盒的试验以及成品检验项目和标准确定：性状、无菌、敏感性、特异性、重复性、消长规律
- 保存期

Pathogen-based seed establishment and identification; antigenicity, specificity and purity, preservation conditions

Comparative experiments: with whole bacteriophage, etc., other fragments that

Production process studies: antigen preparation

Optimization of diagnostic methods

Assembly and finished product inspection

Tests of the kits as well as finished product testing programs and criteria for determining: traits, sterility, sensitivity, specificity, reproducibility, pattern of extinction

Shelf life

Pilot

中试

- GMP生产车间
- 连续生产5~10批次试剂盒
- 全面检验
- 必要时调整生产工艺适应大规模生产

GMP workshop

Continuous production of 5 to 10 batches of kits

Comprehensive testing

Adaptation of production processes to mass production, if necessary

Clinical Trials

临床试验

- 一定数量的试剂盒中试产品
- 大量临床样品（阳性和阴性样品）
- 检测试验
- 确定试剂盒的实际应用效果

- a certain number of kit pilot products
- Large number of clinical samples (positive and negative)
- detection tests
- Determining the effectiveness of the practical application of the kit

回肠炎抗体ELISA核心研发路径

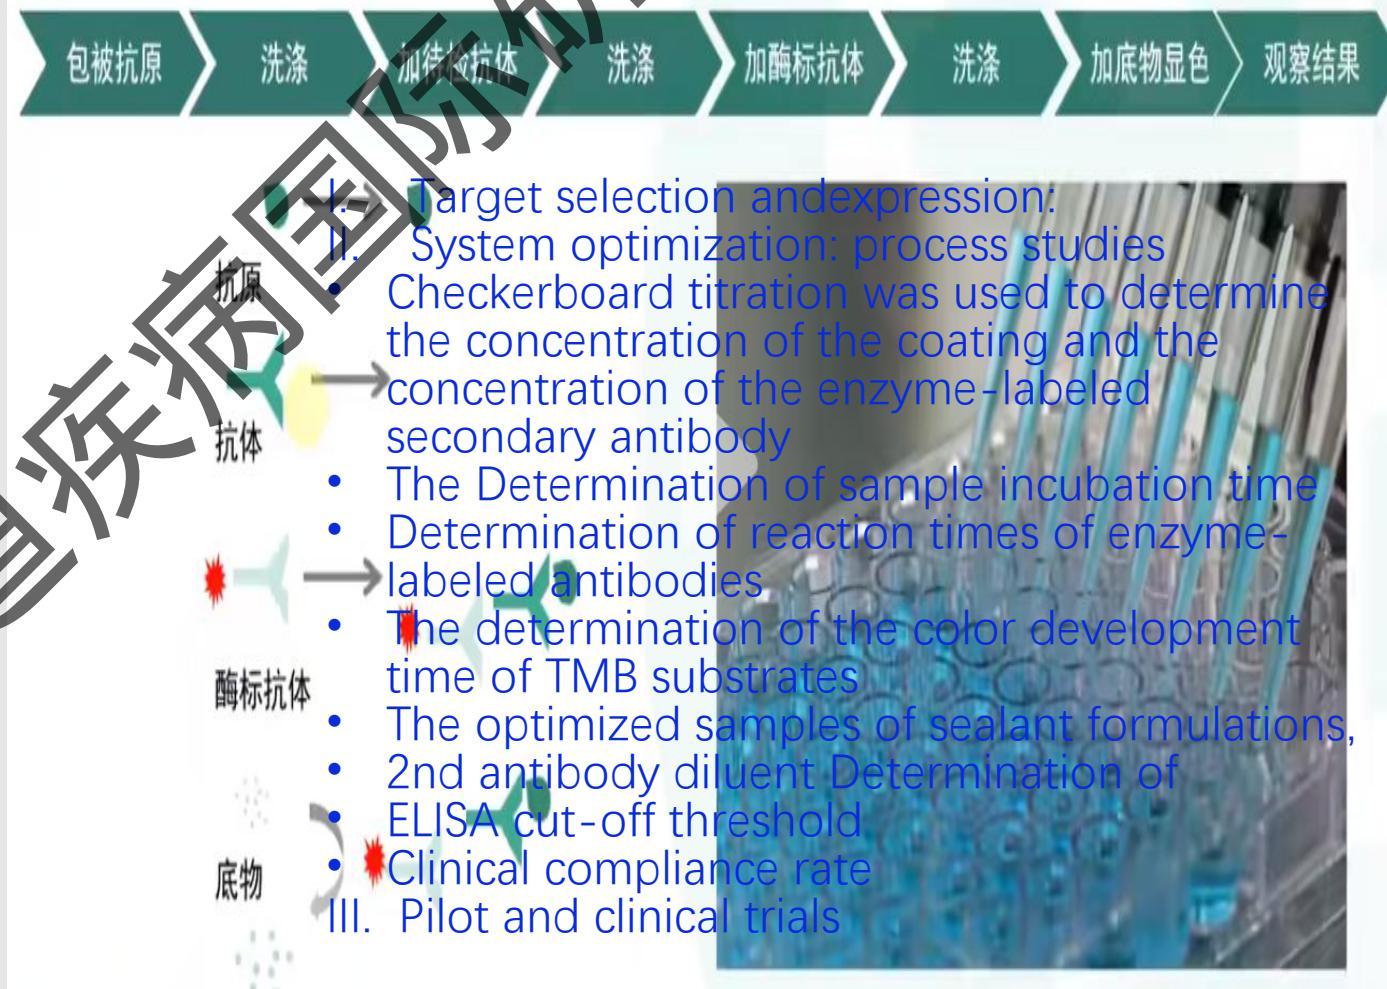

Core research and development path of ileitis antibody ELISA

一、检测靶标选择及表达:

二、体系优化:工艺研究

- 棋盘滴定法确定包被浓度和酶标二抗浓度
- 样本孵育时间的确定
- 酶标抗体反应时间的确定
- TMB底物显色时间的确定
- 封闭液配方的优化样本
- 样本稀释液配方的优化
- 酶标二抗稀释液配方的优化
- ELISA临界值cut off line的确定
- 临床符合率

三、中试和临床试验

检测靶标选择 Detecting target selection

1、包被胞内劳森菌、脂多糖

优点：覆盖面广，更灵敏

缺点：细菌为专性胞内菌。体外难以培养。不安全。

2、包被胞内劳森菌表外膜蛋白、鞭毛膜蛋白

优点：能体外高效表达

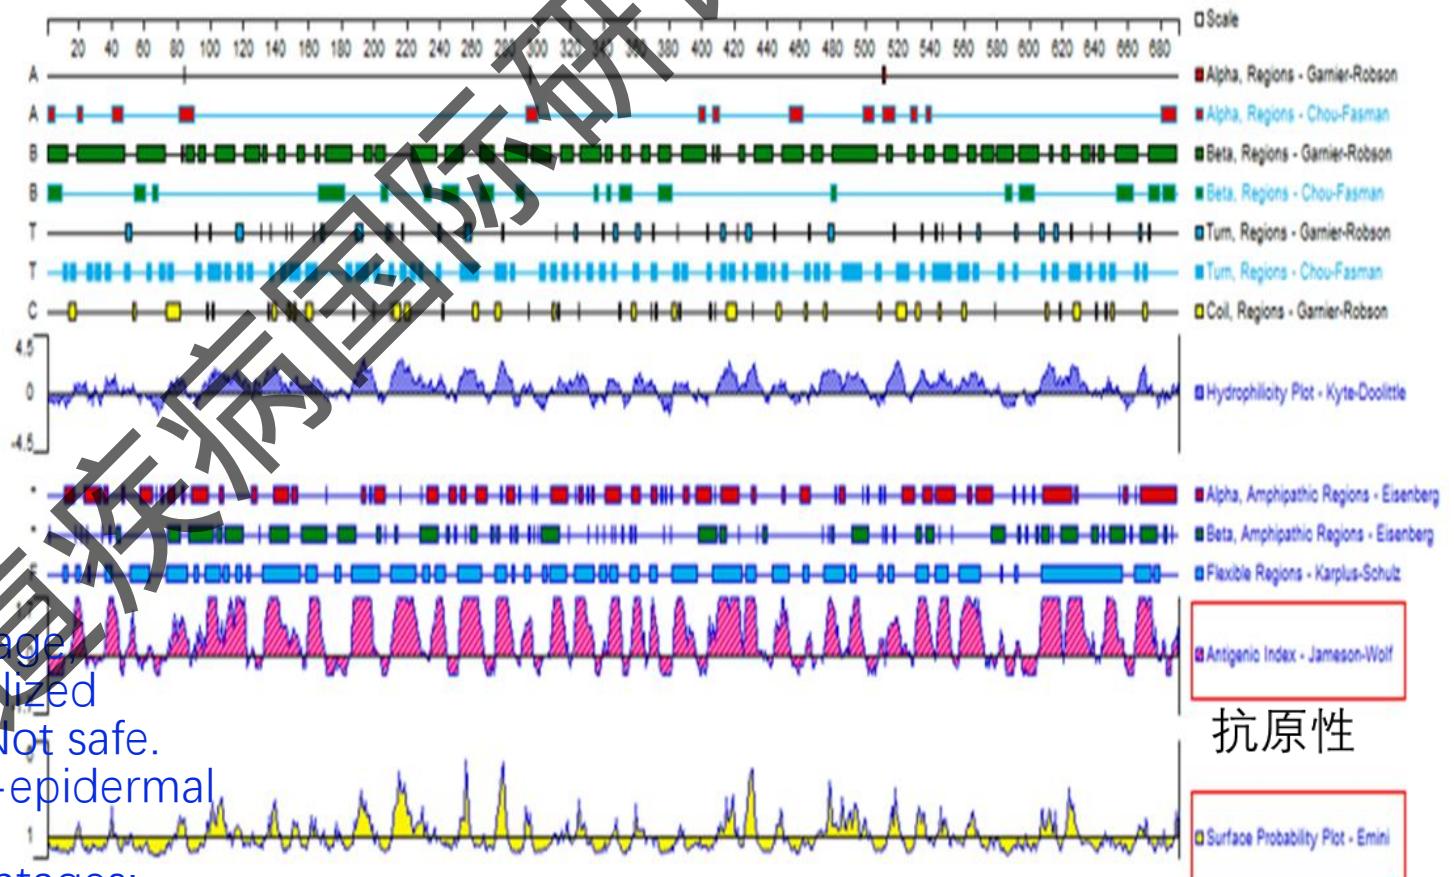

缺点：单个蛋白覆盖面不广，灵敏度差

3、选择flgE蛋白（鞭毛钩-基体复合蛋白），根据序列特点有选择性进行优化蛋白表达。

1. Encapsulation of intracellular *Lawsonia*, lipopolysaccharide that Advantages: Wide coverage, more sensitive. Disadvantages: Bacteria are specialized intracellular bacteria. Difficult to culture invitro. Not safe.

2. Encapsulation of intracellular *Lawsonian* extra-epidermal membrane proteins, flagellar membrane proteins Advantages: Efficient in vitro expression. Disadvantages: poor coverage of individual proteins, poor sensitivity

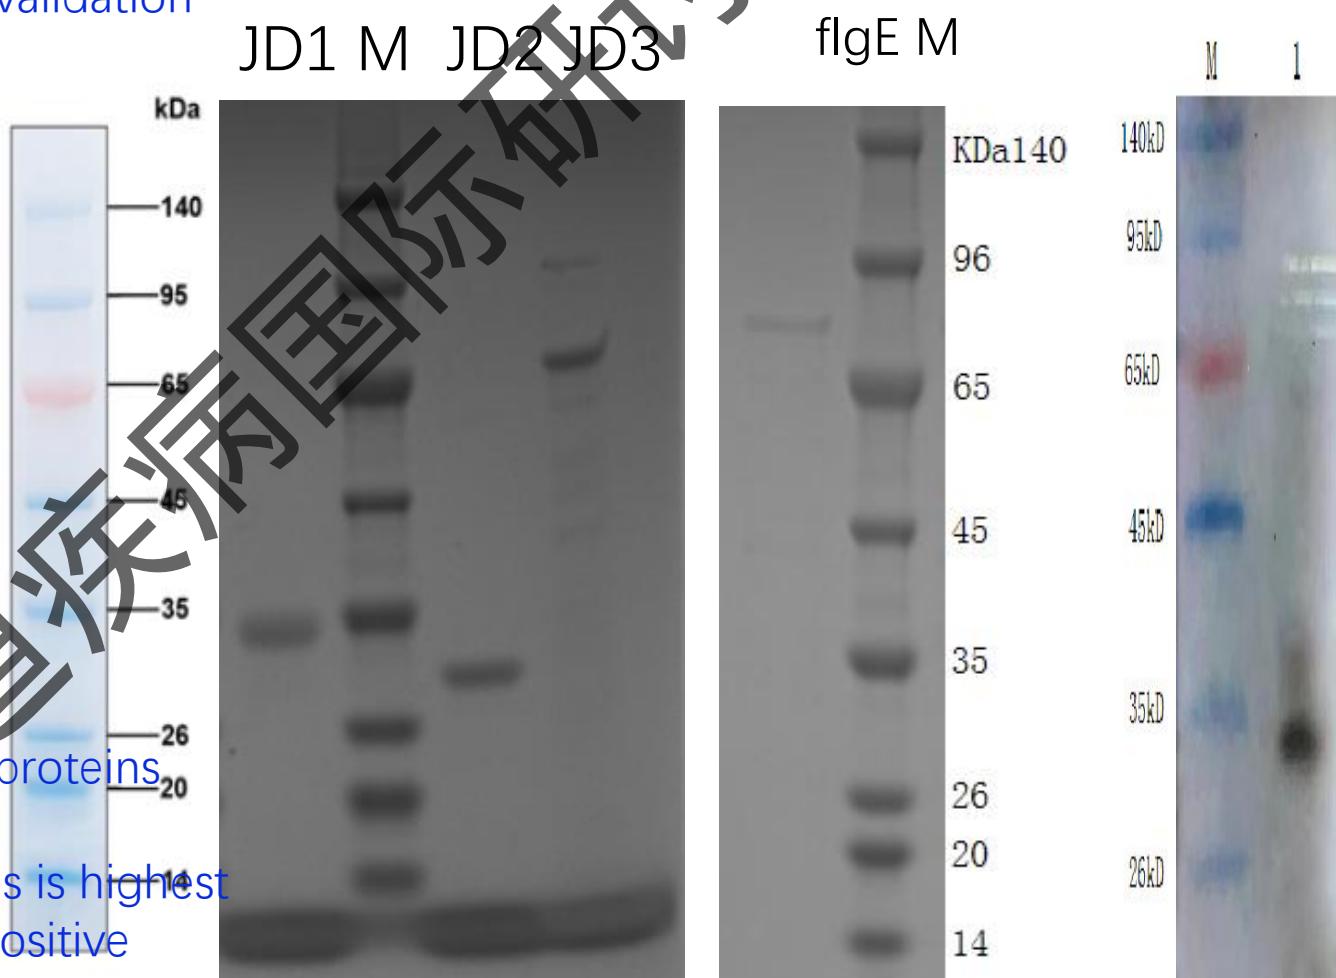

3. Select flgE protein (flagellar hook matrix complex protein) and selectively optimize protein expression based on sequence characteristics.

flgE蛋白（鞭毛钩-基体复合蛋白）部分抗原性预测

蛋白表达及验证 Protein expression and validation

- 全长和三种截短蛋白均能有效表达。
 - 胞内劳森菌阳性血清的杂交中，JD1蛋白与抗体的结合能力最高。
 - 仍需进一步分析，来筛选最适的靶标抗原。
-
- Both full-length and three types of truncated proteins can be effectively expressed.
 - The binding ability of JD1 protein to antibodies is highest in the hybridization of intracellular Lawsonia positive serum.
 - Further analysis is still needed to screen for the most suitable target antigen

3种不同的截短可溶性表达及全长flgE蛋白表达及鉴定

ELISA临界值cut off line的确定 Determination of ELISA cut-off threshold

117份正常猪血清样品（IFA验证为阴性的样本）稀释，在筛选的最佳条件下进行间接ELISA测定，设置阴性对照孔，对检测结果进行统计学分析，得到OD450nm，计算S/P值平均值（X）和标准差（SD），将S/P值 $\geq X+3SD$ （即S/P值0.504）时，判为阳性；S/P值 $<X+2SD$ 即（S/P值0.415）时，判为阴性，介于两者之间判为可疑。

117 normal pig serum samples (samples verified as negative by IFA) were diluted and subjected to indirect ELISA testing under the best screening conditions. A negative and positive control well was set up, and the test results were statistically analyzed to obtain OD450nm. The average S/P value (X) and standard deviation (SD) were calculated. When the S/P value $\geq X+3SD$ (i.e. S/P value 0.504), it was judged as positive; When the S/P value is less than $X+2SD$ (S/P value 0.415), it is considered negative, and if it falls between the two, it is considered suspicious.

总结：回肠炎防控手段

Summary: Prevention and control measures for ileitis

- ✓ 定期监测、及时隔离淘汰阳性动物
Regular monitoring, timely isolation and elimination of positive animals
- ✓ 适当提高疫苗接种率
Appropriately increase the vaccination rate

- ✓ 药物预防
Drug prevention

Three application scenarios for antibody detection:

- Epidemiological investigation: whether medication and vaccines are needed
- Evaluation of the effectiveness of drug use vaccines
- Evaluation of purification effect on ileitis

核酸检出率高:

- 采样污染: 新鲜粪便
- 环境污染: 猪舍环境
- 建议采集肛拭子
- 采样时间 (夏秋多发)
- 对象: 断奶仔猪和育肥猪

High nucleic acid detection rate:

- Sampling contamination: fresh feces
- Environmental pollution: pigsty environment
- Suggest collecting an anal swab
- Sampling time (frequent in summer and autumn)
- Target: Weaned piglets and fattening pigs

抗体检测的三个应用场景:

- 流行病学摸底: 是否需要用药和疫苗
- 用药用苗效果评估
- 回肠炎净化效果评估
